

**BITS Pilani**

## **Presentation for Project**

**2022-23**

Course - CS F212

Course Name - Database Systems

Evaluation - Mid semester evaluation

# Group Details

---

Group number: **61**

Group members:

Nidhi Agarwal

2020A4PS2009H

Swastik Ranjan

2020A4PS0990H

Rohan Khond

2020B3A70728H

Shubham Agrawal

2020B3A70505H

Vassvik Reddy

# EER Diagram- Business Rules

Business Rules
1)A property may not have a tenant
2)A property must be either residential or commercial type
Permissions
1)The DBA can add/ modify/ delete the users of the system.
2)The Managers can add/ modify/ delete the properties.

# EER Diagram- Assumptions

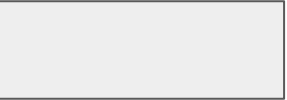

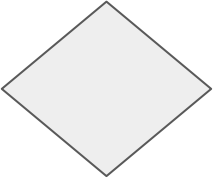

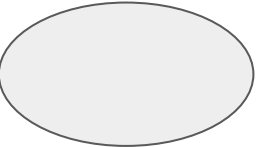

Assumptions
A tenant will rent AT LEAST 1 property
A property will have NOT MORE THAN 1 tenant at a time
A manager is not an owner or a tenant
The DBA doesn't own/rent properties
One property will have ONLY ONE owner
One owner can OWN 0 to N properties

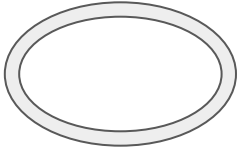

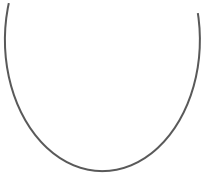

# EER Diagram

achieve

lead

# Mapping EERD to Relations

Mapping Rules followed:

1:N cardinality (owner:property)	Adding ID of subclass “Owner” to the “Property” table to capture relation between owner and property
Disjoint and Total(residential and commercial types in property)	Since only 1 attribute, adding that in the main table itself and having a typeID for identification
Relationship Attributes (isRented and Tenant)	Combination of pid and tid as PK in a separate relation along with the relationship attributes

# Mapping EERD to Relations

Mapping Rules followed:

Overlap Disjoint	OwnerID in Owner table pointing towards aid in User table
Multivalued attribute(Contact Number)	Making a separate relation and making aid and phone_no combination as primary key
Role Identification	Having roleID in User and mapping it to Role table RoleID to identify DBA or Manager. For Tenants and Owner, separate tables exist.
